LEADING METAL ROOF INSTALLATION

[WHAT ARE THE TYPES OF METAL ROOFS?]

There are two main types of metal roofing: R-panel and standing seam. Both offer adequate protection against the elements and are often recommended for areas prone to extreme wind. An R-panel roof is typically called an exposed fastener system because the fasteners used to connect the panels are exposed, or seen on the outside of the roof. A standing seam roof has no exposed fasteners, and the panels clip into each other; for this reason, standing seam roofs tend to be more weather resistant.

[HOW IS A METAL ROOF INSTALLED?]

There are two substrates that a metal roof can be installed on: open framing and solid decking. When metal panels are installed to an open frame substrate, they are directly attached to the building's purlins. For installation on a solid deck, typically CDX or OSB, the metal panels are fastened to the decking. Prior to installing the panels, a moisture shield is installed over the decking to minimize failure.

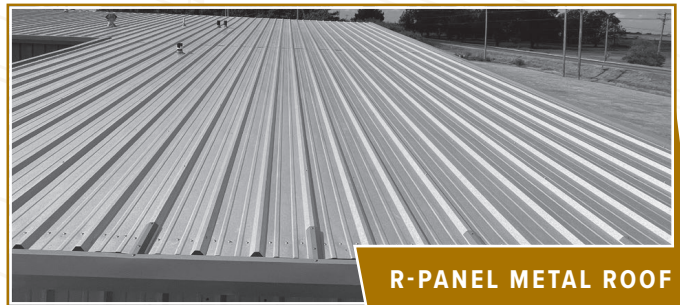

[BENEFITS OF METAL ROOFS]

There are many great benefits of upgrading your building to a metal roof system, including:

- + Long Life Span
- + Resistance to Fires
- + Easily Retrofitted
- + Low Maintenance
- + Can Sustain High Wind Gusts
- + Improved Energy Efficiency

STANDING SEAM METAL ROOF

R-PANEL METAL ROOF

WARRANTY

[2-YEAR WORKMANSHIP WARRANTY]

- + Dedicated Warranty Department
- + Network of Service Providers
- + 24/7 Response
- + 20- to 30-Year No Dollar Limit (NDL) Warranty Available
